NURSE CALL SYSTEM

COMPONENTS

Watch

This is worn on the wrist and has **two-way voice**, **fall detection** and a **GPS locator feature**. It is a chargeable device which takes care of the patient if they are outside of their rooms or taking a walk in the premises. It has seamless integration with other **Nurse Call Components**.

Pendants

Pendants are the same as watches but can be worn around the neck. They also feature **two-way voice**, **hard fall detection** and have a **GPS locator** to share the precise location of the wearer to the operator.

Call Points

Call points behave like remote control to contact nursing staff. They have **IP dialled** feature which gives signals to nurses on their devices so they can easily connect to patients in need.

Dialler

The dialler is a fixed device installed at elderly care facilities or hospitals and comes with other **wearable devices** which only work around **100 metres** of the dialler. When activated, it connects with the operator to send signals.

Reporting

Provides a comprehensive **enterprise level reporting** for better **insight** of the overall flow of the **Nurse Call System**. This further helps organisations to improve services creating greater patient satisfaction.

NURSE CALL SYSTEM

FEATURES

- Designed with static windows.
- Voice module with standard voice attention and patient calling instead of buzzer makes it distinguished.
- Very low working voltage to ensure patient's safety.
- Door indicator helps the nurses to locate the calling patient easily.
